Work Experience:

QA Engineer | Ring / Amazon - Los Angeles, CA

(May 2022 - Present)

Project: Battery Pack

- Designed and developed custom hardware test devices for various scenarios, including a Raspberry Pi-based test system with UART communication and an integrated programmable resistive load for controlled discharging from a power source.
- Created and implemented comprehensive test suites to support firmware development and eventually system-level testing.
- Wrote various test scripts to validate battery features. Initially written in bash and eventually converted to Python for better extensibility and coverage.
- Responsible for measuring and tracking power consumption throughout development in order to minimize power loss and investigate areas for potential savings.

Project: Ring Car Camera

- Supported a successful product launch by leading field tests and system-level testing up until release.
- Spearheaded execution of thermal tests in order to characterize devices' thermal behavior in very hot environments. Data was used to develop a thermal policy that is active in all distributed dash cameras today.
- Assisted with managing a cohort of early access testers with the goal of assigning homework, collecting sentiment, and analyzing data before the device reached market.

Engineering Internship | Scener - Seattle, WA

(June 2020 - January 2021)

- Identified and reported bugs and technical issues during testing phases, collaborating with end-users to determine root causes and promptly communicated findings to the development team.
 - Gained active experience working in an agile development environment on a web product with over 2 million users.
 - Managed high volumes of daily user tickets to identify key points of concern and relay them to the greater team.
 - Developed an automated regression test suite using Selenium and Python to streamline testing processes.
-

Education:

B.S in Computer Engineering | Seattle University - Seattle, WA | May 2021

Extracurriculars: NCAA Division I Student-Athlete, IEEE Student Chapter Leader, SAAC Member, Undergraduate Student Researcher

Projects:

Electric Meter Simulation Application - Senior Design Capstone (2021)

- Designed and developed a phone application capable of simulating simple and complex waveforms for output from a phone's audio jack.
- Applied specific concepts from my coursework to achieve our end-goal. Leveraging concepts like digital signal processing and superposition with the intent to generate specific waveforms defined by the user.
- Delivered a working application written in Python that could be used by sales and test engineers in order to demo their product line to potential customers.
- Learned the importance of non-technical skills like project management, team collaboration, fulfilling client expectations, and time management while collaborating with a team of 4 students.

Skills:

Coding Languages: Python, C++, C, C#

Additional Skills: Programmatic data analysis, soldering, test device bring-up, thermal testing, test case writing and execution, testing frameworks like Pytest, and extensive experience with hardware test devices and lab equipment.
